Brailogue Introduction

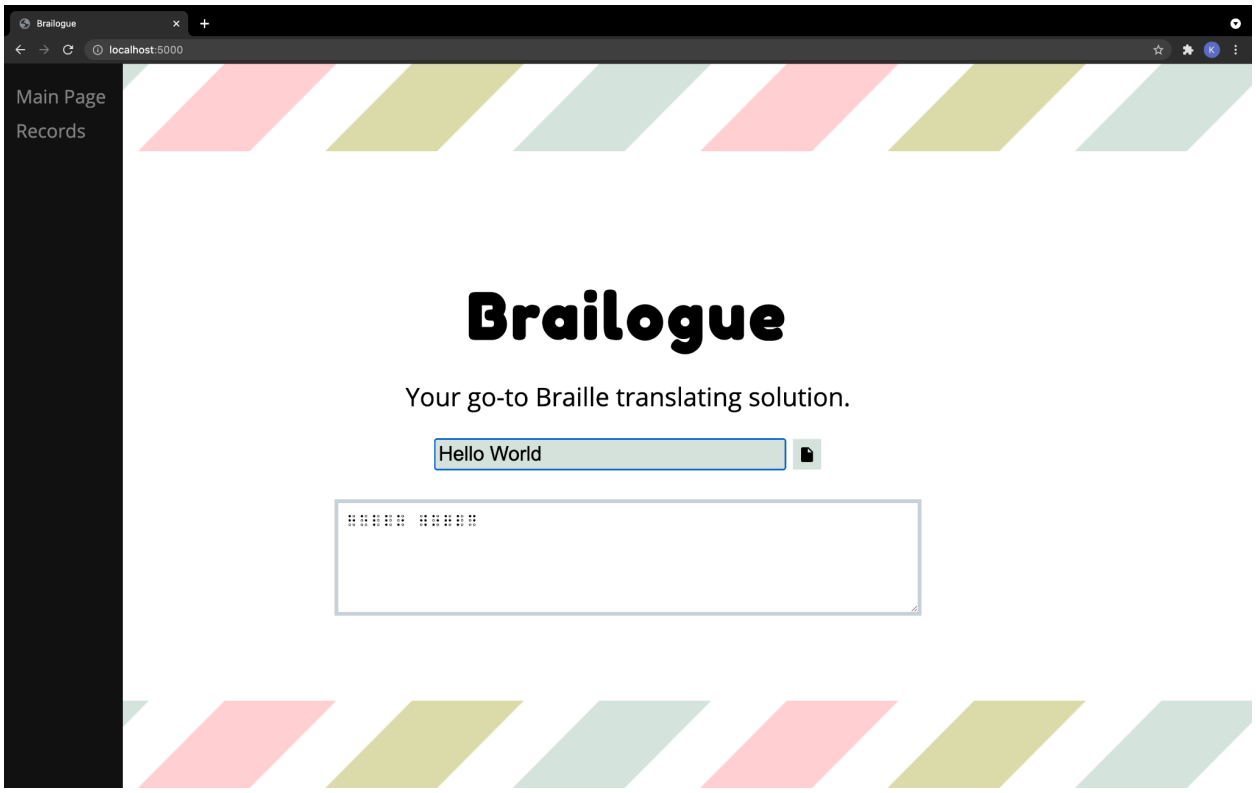
Problem statement
There are many people who have friends or family who are blind and find it hard to communicate with them. A tool such as Brailogue can be used as a means to communicate with the blind across the internet. The braille output can theoretically be used to communicate with them with the use of digital braille boards.

Target Audience
Friends and family of blind people and blind people.

Abstract
Blind people read materials via braille. Translators for English to Braille exist but lack the functionality and break easily. Braillogue is our solution to this problem. Braillogue allows users to input a large amount of text to be translated and even allows the translation of youtube captions and audio files.

User Guide

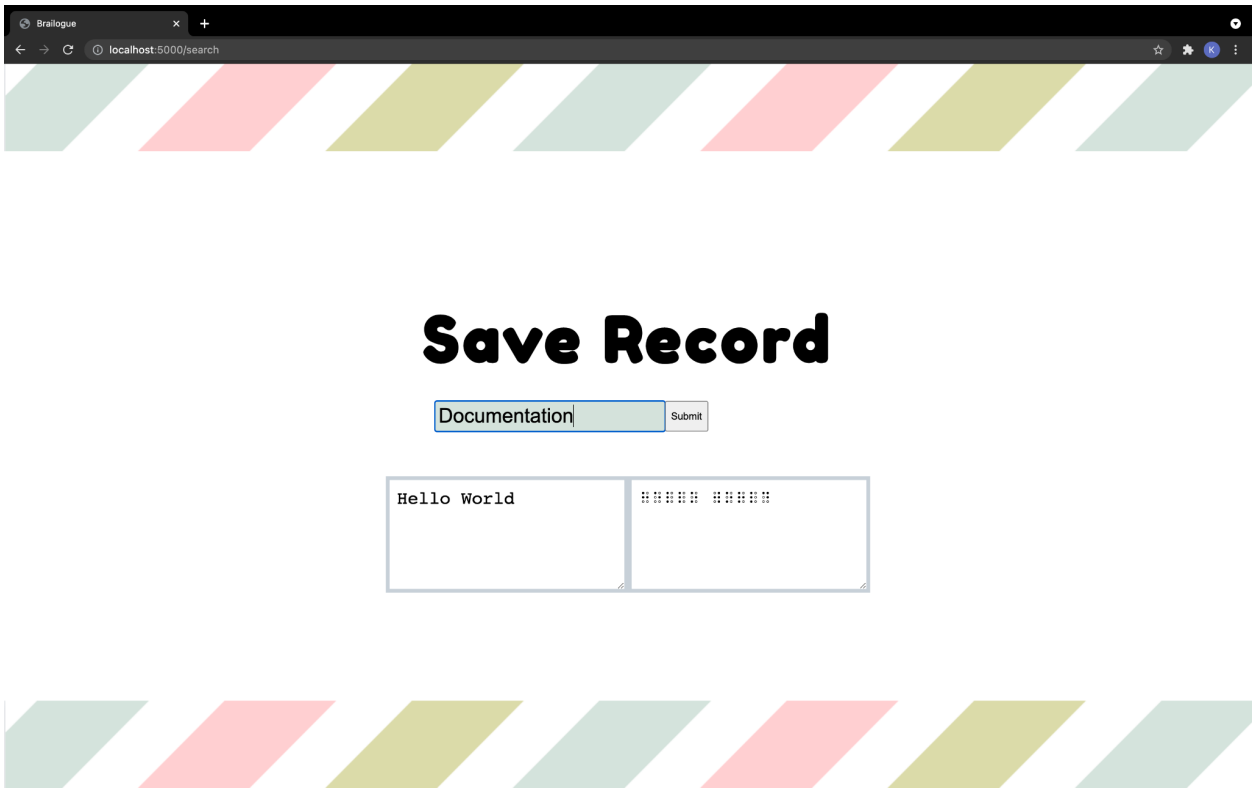
Main Menu



Possible Test Cases:
Boundary: “()”
Normal: “Hello World”
Error: 😊

The file icon is used to save a record of text and braille.

Saving A Record



Possible Test Cases:
Possible Test Cases:

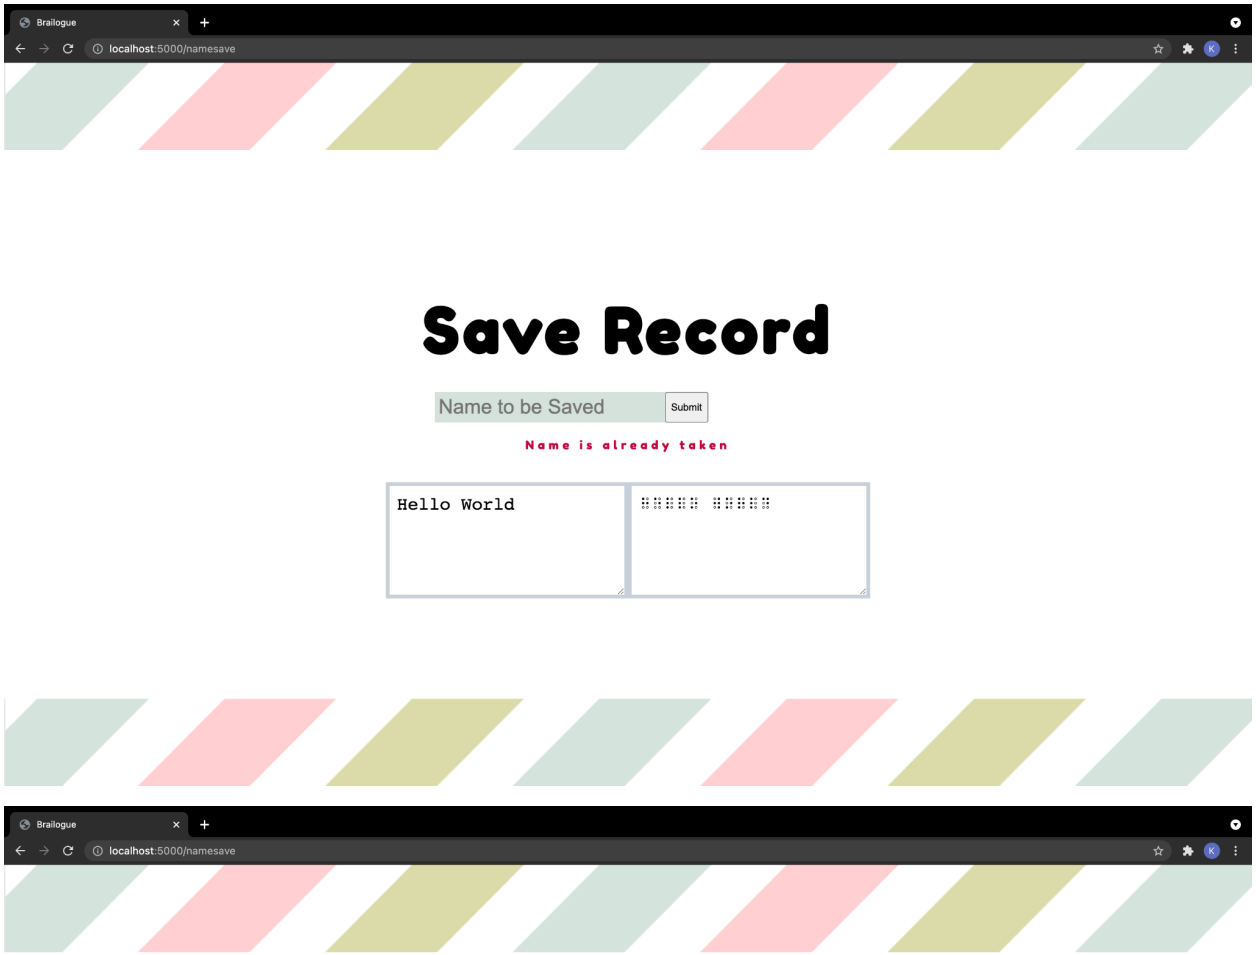
Normal: “Hello World”
Error: 😊

The submit button is used to submit the name and record into a database. If the name chosen is already in use, it will indicate that the name is already in use. If the name chosen is unique, it will indicate that the save was successful and will redirect the user to the main menu after displaying the message for 3 seconds.



Successful Submission to Database

Record Viewing and Editing

This page can be accessed by the sidebar
Records can be updated or deleted. (When deleting, only the Initial Name field is to be filled). If the name of the record does not exist, it will simply display a message of the record not being there and return the user back to this page. If successful, the update or deletion will be reflected in the page

No Such Record Exists
